

**HOOD FOR VEHICLE SEAT HEADREST INCLUDING A VIDEO SYSTEM****REFERENCES TO RELATED APPLICATIONS**

5        This application claims the benefit of Provisional  
Application Serial No. 60/423,675, filed on November 4, 2002,  
the contents of which are herein incorporated by reference.

**BACKGROUND OF THE INVENTION**

10    1.    Field of the Invention:

      The present invention relates to a video system, and more  
particularly to a video system formed in a hood capable of  
fitting over a vehicle seat headrest.

15    2.    Discussion of Related Art:

      As society becomes more mobile and therefore spends a  
greater amount of time traveling and away from home, demand  
rises for electronic appliances and devices outside the home  
environment. For example, as shown in Figures 1 and 2, video  
20    screens 101 have been mounted in the headrests 102 of vehicles,  
facilitating video entertainment on the road. These video  
screens may be connected to video players, such as a video  
cassette player (VCP) or a digital video disk (DVD) player  
located, for example, in the glove box of the vehicle. However,  
25    the video player and video screen cannot be removed from the

vehicle or transferred to another vehicle. Thus, videos may only be viewed with such systems when occupying a specific vehicle. Further, there is also a risk of theft of the video screen and video player and corresponding damage to the vehicle  
5 when the vehicle is left unattended.

Therefore, a need exists for a video system that is removable from a vehicle and can be transferred from one vehicle to another with relative ease.

## 10 **SUMMARY OF THE INVENTION**

A video system, according to an embodiment of the present invention, includes a hood sized for fitting over a vehicle seat headrest, wherein the hood includes a display connectable to a media player.

15 In alternate embodiments, the video system may include a frame for mounting the display, wherein the frame is attached to the hood, and the media player may be located in the hood. The video system may further include a base portion attached to the hood, and a door pivotally attached to the base portion, wherein  
20 the display and the media player are mounted to the door. The media player may be one of a slot-type and a clamshell-type device.

The video system may include a docking station attached to the hood, a base portion selectively coupled to the docking

station, wherein the base portion can be selectively decoupled from the docking station, and a door pivotally attached to the base portion, wherein the display and the media player are mounted to the door. The video system may also include a  
5 wireless transmitter having one of an optical transmitting device and an antenna, wherein the wireless transmitter transmits wireless signals on more than one channel. The video system may further include a cover for covering the display, a port for connecting to an external device, at least one  
10 controller for controlling functions of the display, and a drawstring on the hood for tightening the hood to the vehicle seat headrest. The display may be connected to a power source of the vehicle.

Another video system, according to an embodiment of the  
15 present invention, includes a hood sized for fitting over a vehicle seat headrest, wherein the hood includes a display and a media player, a base portion attached to the hood, and a door pivotally attached to the base portion, wherein the display is mounted to the door and the media player is one of mounted to  
20 the door and mounted in the base portion.

In alternate embodiments, the media player may be one of a slot-type and a clamshell-type device. The video system may include a wireless transmitter having one of an optical transmitting device and an antenna, wherein the wireless

transmitter transmits wireless signals on more than one channel. The video system may further include a cover for covering the display, a port for connecting to an external device, at least one controller for controlling functions of the display, and at  
5 least one controller for controlling functions of the media player. The display and the media player may be connected to a power source of the vehicle. The hood may include a drawstring for tightening the hood to the vehicle seat headrest. The display may be mounted on a front side of the door and the media  
10 player may be mounted on a backside of the door. The display may be coupled to the media player through an opening in the door. The door may pivot in a range of angles including approximately 0° to 180° with respect to the base portion, and may consist of an open center section bordered by a frame,  
15 wherein the display and media player are positioned in the open center section.

A hood for fitting over a vehicle seat headrest, in accordance with the present invention, includes a docking station for receiving and securing a video system, wherein the  
20 docking station includes means for securing the video system to the docking station, and means for providing power to a secured video system.

In alternate embodiments, the video system may include a base portion attachable to the docking station and an external

power supply for use when the base portion is detached from the docking station. The means for providing power to the secured video system may include at least one pin array. The pin array may carry one of an audio and a video signal from the secured video system to an external device. The hood may include a drawstring for tightening the hood to the vehicle seat headrest and the docking station may be connected to a power source of the vehicle.

#### **BRIEF DESCRIPTION OF THE DRAWINGS**

Preferred embodiments of the invention can be understood in more detail from the following descriptions taken in conjunction with the accompanying drawings in which:

Figure 1 is an illustration of a video screen installed in a vehicle headrest;

Figure 2 is an illustration of a video screen installed in a vehicle headrest;

Figure 3 shows a hood including a display according to an embodiment of the present invention;

Figure 4 shows a wireless transmitter according to an embodiment of the present invention;

Figure 5 shows a hood with a display according to an embodiment of the present invention;

Figures 6A-6C show a hood including a display and an entertainment device according to an embodiment of the present invention;

Figures 7A-7E show a hood including a display and an entertainment device according to an embodiment of the present invention;

Figures 8A-8D show a hood including a display and an entertainment device according to an embodiment of the present invention;

Figure 9 shows a hood including a display and an entertainment device according to an embodiment of the present invention;

Figures 10A-10B show a hood including a docking station according to an embodiment of the present invention;

Figures 11A-11B show a docking station according to an embodiment of the present invention; and

Figures 12A-12B show mechanisms for securing and releasing a video system to and from a docking station according to embodiments of the present invention.

20

#### **DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS**

Preferred embodiments of the present invention will be described below in more detail with reference to the accompanying drawings. This invention may, however, be embodied

in different forms and should not be construed as limited to the  
embodiments set forth herein. Rather, these embodiments are  
provided so that this disclosure will be thorough and complete,  
and will fully convey the scope of the invention to those  
5 skilled in the art.

According to an embodiment of the present invention, a  
video system can be integrated into a hood that fits over  
vehicle seat headrest. The hood including the video system is  
removable and can be transferred from one vehicle to another  
10 vehicle.

Referring to Figure 3, a hood 200 having a display 220 is  
shown. The hood 200 is dimensioned and configured substantially  
like a headrest (shown sitting on a headrest frame 230) of a  
vehicle seat for convenient installation within a vehicle by  
15 slipping the hood 200 over the headrest. A drawstring 250 can  
be used to draw close the opening 270 after the hood 200 is  
placed on the headrest. Elastic can be used in place of the  
drawstring 250 to close the opening 270. The hood 200 is  
preferably made from a flexible material such as cloth or  
20 leather.

The display 220 is mounted in a display frame 210, which in  
turn is attached to the hood 200. The frame 210 may consist of  
an outer frame (not shown) that can be closed into an inner  
frame (not shown), wherein the frame 210 is attached to the hood

200 by closing the outer frame into the inner frame with the hood 200 sandwiched in between the outer and inner frames. Alternatively, the frame 210 can be glued or epoxied onto the hood 200.

5       The display 220 fits snugly into the frame 210. The display 220 has a thin display screen, preferably an LCD type screen, for displaying video information. A control panel 280 on the display 220 includes control buttons 281 for controlling the on screen display characteristics.

10       The display 220 may include input and output ports. For example, audio/video input/output ports 282, a headphone port 283, a power port 284 and an IR port 285 for transmitting and/or receiving, for example, remote control signals. It should be understood that other port types can be provided, for example, a  
15   USB port or RCA jack for connecting to a game controller or headphones. The ports can be positioned at any convenient location on the display 220, for example, on a bottom portion, a top portion, or a side portion of the display 220.

      A speaker (not shown) also can be mounted in the hood 200,  
20   or to the frame 210 or display 220, for presenting audio information in connection with a video program being played. Alternatively, audio may be provided to vehicle occupants through the existing vehicle audio system.

To provide for audio reception through wireless headphones, the display 220 may include a wireless transmitter 295 for transmitting wireless signals to wireless receivers in wireless headphones. The wireless signals may include radio frequency signals for use with, for example, Bluetooth® wireless systems or infrared (IR) signals for use with, for example, Whitefire® systems. It is preferred that the wireless transmitter 295 has the capability to transmit wireless signals over more than one channel operating at a different frequency for each channel. The use of more than one channel, for example, avoids interference between more than one wireless headphone user watching different programs on different displays. Wireless signals also may be encoded to prevent interference between wireless headphones. Such encoding may be based on, for example, spread spectrum technology.

As shown in Figure 4, the wireless transmitter 295 includes an optical transmitting device 296 (e.g., an LED, a laser, and so forth) and an antenna 298. The optical transmitting device 296 and the antenna 298 may be used for wireless transmission of IR signals and RF signals, respectively.

Referring back to Figure 3, at least one cable 240 is attached to the display 220 and is extended from the inside of the hood 200. A connector 290 connects to an entertainment device (not shown) such as a DVD player, VCP, TV tuner, or game

console. Cable 240 can run down the seat back and the entertainment unit can be placed under the seat. The cable 240 preferably includes conductors for receiving video, audio, and power, and may also lead to external devices such as a slave  
5 video display unit or a vehicle sound system.

Figure 5 shows another embodiment of a hood 300 having a display 320. Hood 300 is slipped over a headrest attached to headrest frame 330. String 350 closes an opening 370 in the hood 300 around the bottom of the headrest. Display 320 is  
10 mounted on display frame 310, which is attached to hood 300 in a similar manner as explained for the hood 200 of Figure 3. A flap 360 is attached to a lower portion of the hood 300. The flap 360 is used to cover the display 320 when it is not in use. Velcro members 362 and 364 are used to couple the flap 360 in  
15 its closed position. The flap 360 can also be closed by a zipper (not shown). Like the hood 200 shown in Figure 3, a cable 340 is attached to the display 320 and is extended from the inside of the hood 300 for connecting to a separate entertainment device and receiving power from the vehicle.

20 Figures 6A-6C show another embodiment of a hood 400, wherein an entertainment device 700, such as a DVD player, MPEG player 3 (MP3) or video game player, is integrated into the hood 400 along with the display 420. The hood 400 is similar to the hoods 200, 300, including a drawstring 450 (or elastic) for

drawing close an opening 470 after the hood 400 is placed on a headrest. A flap used to cover the display 420, like the flap 360 shown in Figure 5, may be attached to a portion of the hood 400 and Velcro members or a zipper may be used to close the flap.

As shown in Figures 6A-6C, a door 402 is connected via a hinge or hinges 404 to the base portion 410. The door 402 includes the display 420 and the entertainment unit 700 formed on opposite sides thereof. A connection between the display 420 and the entertainment unit 700 may be achieved through appropriately positioned openings in the door 402.

Alternatively, the door 402 may consist of an open center section surrounded by a frame, wherein the display 420, including the entertainment unit 700 coupled to its rear, snugly fits into the open center section bordered by the frame. The display 420 and the entertainment unit 700 can be fixed to the door 402 by, for example, screws, catches, adhesives, molding, pressure fitting and/or any other means known to those skilled in the art. Similarly, the base portion 410 can be fixed to the hood 400 by, for example, screws, catches, adhesives, epoxies and/or any other means known to those skilled in the art.

The hinge 404, located at a top portion of the door 402, allows the door 402 to pivot away from the base portion 410 to expose a slot 702 in the entertainment device 700 for receiving

a data media, such as a DVD. The hinge 404 may be positioned at top, side or bottom portions of the door 402, and depending on the location of the hinge 404, the slot 702 may be positioned at top, side or bottom portions of the entertainment device 700.

- 5 The door 402 may be opened, for example, by pulling a tab 403 and/or by depressing a button (not shown) releasing the door 402 from the base portion 410.

Like the displays 220, 320 of the previously described embodiments, the display 420 has a thin display screen,  
10 preferably an LCD type screen, for displaying video information. A control panel 480 on the display 420 includes control buttons 481 for controlling the on screen display characteristics.

Like the wireless transmitter 295 and the input/output ports 282-285 described above, a wireless transmitter 495 and  
15 input/output ports 482-485 may be positioned at any convenient location on the door 402, the display 420 or base portion 410.

Further, a speaker (not shown) can be mounted in the hood 400 or in the entertainment unit 700, or to the door 402, base portion 410 or display 420, for presenting audio information in  
20 connection with a video program being played. Also, audio may be provided to vehicle occupants through the existing vehicle audio system. The hood 400 may also include a cable 440 connected to the video system therein that is capable of connecting to a vehicle's power supply and to external devices,

such as, for example, a slave video display or a vehicle sound system.

Controls 706 for controlling functions of the entertainment device 700, such as, volume, previous, next, pause, eject, play  
5 and power on/off may be positioned on the hood 400, door 402, display 420, and/or the entertainment device 700. The controls 706 can be, for example, buttons, switches, a touch sensitive liquid crystal display and the like.

Figures 7A-7E show another embodiment of a hood 500,  
10 wherein an entertainment device 800, such as a DVD player, MP3 or video game player, is integrated into the hood 500 along with the display 520. The hood 500 is similar to the hoods 200-400, including a drawstring 550 (or elastic) for drawing close an opening 570 and may include a flap, like the flap 360 shown in  
15 Figure 5, to cover the display 520.

As shown in Figures 7A-7E, a door 502 is connected via a hinge or hinges 504 to the base portion 510. The door 502 includes the display 520 and the entertainment unit 800 formed on opposites sides thereof, like the door 402 and the  
20 entertainment unit 700 of the previously described embodiment. The display 520 and the entertainment unit 800 can be fixed to the door 502 and the base portion 510 can be fixed to the hood 500 by the same or similar means to those previously described in connection with the hood 400.

The hinge 504, located at a top portion of the door 502, allows the door 502 to pivot 180° away from the base portion 510 to expose a cover 802 of a clamshell-type entertainment device 800 that can be opened to allow insertion of a data media, such as a DVD, into the entertainment device 800. A hinge 504 that allows the door 502 to pivot more or less than 180° can be used provided that easy opening of the cover 802 and subsequent insertion or removal of a data media from the entertainment unit 800 can be achieved. The hinge 504 may be positioned at top, side or bottom portions of the door 502. The door 502 may be opened, for example, by pulling a tab 503. A button (not shown) may be depressed releasing the door 502 from the base portion 510. The cover 802 may be opened, for example, by pulling a tab (not shown) and/or by depressing a button 803 releasing the cover 802 from the entertainment unit 800.

Like the displays 220-420 of the previously described embodiments, the display 520 has a thin display screen, preferably an LCD type screen, and may include a control panel 580 with control buttons 581 for controlling the on screen display characteristics.

Like the wireless transmitter 295 and the input/output ports 282-285 described above, a wireless transmitter 595 and input/output ports 582-585 may be positioned at any convenient location on the door 502, the display 520 or the base portion

510. Also, audio may be provided to vehicle occupants through the existing vehicle audio system or through a speaker mounted in the hood 500 or entertainment unit 800, or to the door 502, base portion 510 or display 520. For example, speakers 832 are  
5 shown mounted in the entertainment unit 800. Like the cable 440 described above, the hood 500 also may include a cable 540 for connecting to a vehicle's power supply and to external devices.

Further, like the controls 706, controls 806 for controlling functions of the entertainment device 800, may be  
10 positioned on the hood 500, door 502, display 520, and/or the entertainment device 800.

Figures 8A-8D show another embodiment of a hood 600, wherein an entertainment device 900, such as a DVD player, MP3 or video game player, is integrated into the hood 600 along with  
15 the display 620. The hood 600 is similar to the hoods 200-500, including a drawstring 650 (or elastic) for drawing close an opening 670 and may include a flap, like the flap 360 shown in Figure 5, to cover the display 620.

As shown in Figures 8A-8D, a door 602 is connected via a  
20 hinge or hinges 604 to the base portion 610. The door 602 includes the display 620 formed on a front side thereof. The display 620 can be fixed to the door 602 by, for example, screws, catches, adhesives, molding, pressure fitting, snugly fitting into an open center section of the door 602 bordered by

a frame and/or any other means known to those skilled in the art. The base portion 610 can be fixed to the hood 600 by the same or similar means to those previously described in connection with other embodiments.

5       The hinge 604, located at a top portion of the door 602, allows the door 602 to pivot away from the base portion 610 to expose a clamshell-type entertainment device 900 positioned in the base portion 610. The entertainment device 900 can be fixed to the base portion 610 by any acceptable means known to those  
10 skilled in the art, such as by screws, catches, adhesives, molding and pressure fitting. The entertainment device 900 includes a cover 902 that can be opened to allow insertion of a data media, such as a DVD, into the entertainment device 900. The hinge 604 may be positioned at top, side or bottom portions  
15 of the door 602. The door 602 may be opened, for example, by pulling a tab 603. A button (not shown) may be depressed releasing the door 602 from the base portion 610. The cover 902 may be opened, for example, by pulling a tab (not shown) and/or by depressing a button 903 releasing the cover 902 from the  
20 entertainment unit 900.

Like the displays 220-520 of the previously described embodiments, the display 620 has a thin display screen, preferably an LCD type screen, and may include a control panel

680 with control buttons 681 for controlling the on screen display characteristics.

Like the wireless transmitter 295 and the input/output ports 282-285 described above, a wireless transmitter 695 and  
5 input/output ports 682-685 may be positioned at any convenient location on the door 602, the display 620 or the base portion 610. Also, audio may be provided to vehicle occupants through the existing vehicle audio system or through a speaker mounted in the hood 600 or entertainment unit 900, or to the door 602,  
10 base portion 610 or display 620. Like the cable 440 described above, the hood 600 also may include a cable 640 for connecting to a vehicle's power supply and to external devices.

Further, like the controls 706, controls 906 for controlling functions of the entertainment device 900, may be  
15 positioned on the hood 600, door 602, display 620, and/or the entertainment device 900. For example, controls 906 are shown in Figure 8D positioned on the entertainment device 900.

Referring to Figure 9, another embodiment of a hood 700, wherein an entertainment device, such as a DVD player, MP3 or  
20 video game player, is integrated into the hood 700 along with the display 720 is shown. The embodiment shown in Figure 9 is the same as the embodiment shown in Figures 6, 7 or 8, except that the display 720 is smaller than the displays 420-620,

allowing more options for positioning components, such as the input/output ports 782-784 and a speaker 732, on the door 702.

Figures 10A-10B show a hood 800 including a docking station 825 capable of securing a base portion of an entertainment device combined with a display, for example, the base portions 410-710 of the embodiments including a combination of an entertainment device and a display. The docking station 825 may be secured to the hood 800 by, for example, screws, catches, adhesives, epoxies and/or any other means known to those skilled in the art.

As shown in Figures 10A-10B, a video system including a display 820 and an entertainment device 1100 can be attached and detached from the docking station 825. Further, the video system, when decoupled from the docking station 825, can operate autonomously on power supplied by an optional battery or a connection to an external power supply, such as AC or DC current. The battery or power supply connection can be to the base portion 810 of the video system.

Referring to Figures 11A-11B, the docking station 825 includes a pin array 826 for connecting to a pin array 827 of the video system. The video system may be any combination of display and entertainment device, including slot or clamshell-type entertainment devices and large or small displays. In addition, other devices, such as video game units, may be

secured to the docking station 825. When the video system is secured to the docking station 825, the pin array 826 and the video system pin array 827 transfer data to and from the entertainment device 1100 and/or display 820. Thus, the video system can be connected to external devices through the docking station 825. The external devices may include a slave video display or a vehicle sound system. Like the cable 440 described above, the hood 800 also may include a cable 840 for connecting to the external devices and to a vehicle's power supply. Power may be supplied to the video system through the pin arrays 826, 827.

Referring to Figure 12A, the docking station 825 may include a quick release mechanism for securing and releasing the base portion 810. The quick release mechanism can include a button 842 for releasing a latch 844, which is secured to the base portion 810 by pressing the base portion 810 securely into the docking station 825. The latch 844 passes into a bottom portion of the base portion 810. The latch 844 is momentarily displaced as the base portion 810 is coupled with the docking station 825. A spring 846 secures the latch 844 in the bottom portion of the base portion 810. The button 842 can be pressed to align the latch 844 with an opening in the bottom portion of the base portion 810, and the video system can be pulled away from the docking station 825. As shown in Figure 12B, the base

portion 810 can be secured by a convex portion 848 on the base portion 810 that fits within a concave portion 849 in the docking station 825. As the video system is pressed into the docking station 825, a wall of the docking station 847 flexes  
5 away from the base portion 810 until the convex portion 848 is aligned with the concave portion 849. The convex portion 848 and the concave portion 849 cooperate to secure the video system to the docking station 825. Thus, a wall of the docking station 847 can be formed of, for example, a flexible thermoplastic  
10 rubber. Other means of securing the video system to the docking station 825 are contemplated, such as, snaps, locks, latches, and the like.

Specifications for the displays 220-820 may include a TFD color liquid crystal display with a diagonal length of 4-8  
15 inches, preferably 5.8 or 7 inches, and a full color TFT active matrix display. The dimensions of the video systems to be fixed to the hoods 200-700, including the display frame or base portion, may be approximately 150-250mm wide, 125-175mm long and 30-60mm thick. The docking station 825 should be sized to house  
20 and secure the base portions of the video systems.

One of ordinary skill in the art can readily appreciate that the hood with the video system or docking station can be placed over any portion of the interior of a vehicle having a shape similar to that of a seat headrest.

In sum, a video system can be integrated into a hood that fits over vehicle seat headrest. The hood is removable and can be transferred between vehicles.

Although the illustrative embodiments have been described  
5 herein with reference to the accompanying drawings, it is to be understood that the present invention is not limited to those precise embodiments, and that various other changes and modifications may be affected therein by one of ordinary skill in the related art without departing from the scope or spirit of  
10 the invention. All such changes and modifications are intended to be included within the scope of the invention as defined by the appended claims.
